

N.	User Story	Points	Validation Factor	Aspect	Penalties / Bonuses (v1)	Feedback	Grade (v1)	Grade
1	As a student, after an attempt, I can get an explanation on the received feedback on a question, so that I can better understand why the answer was wrong. Use an automatic generative method, based on AI, to generate an explanation on a wrong answer, when given a feedback after an attempt. The answer is stored in the attempt so that when the student reopens the attempt, they will see the original answer.	5.0	1.0	Requirements		Ok.	4.25	4.25
				Usability				
				Implementation	-15.0%	The correct answer is included in the prompt, though you miss an explicit directive that imposes not revealing it during the explanation (-10%) Description of the exercise not included (possibly missing context -5%)		
2	As a student, I can ask the AI a specific question on a resource on the materials, so that I can clarify some doubt that I have. The question should be made on a highlighted piece of text of the resource, and it should work on anything internal (in this case, markdown pages).	5.0	1.0	Requirements		Context includes the whole text of the material - it seems to work well enough.	5.00	5.00
				Usability				
				Implementation				
3	As a student, I can rate any AI answer I received or that I can see, so that I can help identify the best ones. You can choose the form of rating you prefer.	2.5	1.0	Requirements		Rating like Stack overflow. Sorting working.	2.50	2.50
				Usability				
				Implementation				
4	As a teacher, I can see the answers given by the AI on materials or on exercise attempts. As a teacher, I should be able to see the answers given by the AI on materials and on exercise attempts.	2.5	1.0	Requirements	-15.0%	Missing context regarding which exercise or which material the question was asked on (-15%)	2.13	2.13
				Usability				
				Implementation				
5	As a teacher, I can make the answers given by the AI public, so that other students can see them. As a teacher, I can make some of the AI answers public, so that the students can see them. In the case of attempt clarifications, the answers should be shown only if the student makes the same mistake as the context of a previously given AI explanation. The UI should take into account the ratings. As soon as an answer is public, the other students can rate it as well.	5.0	1.0	Requirements		Seems to be working relatively well on the feedback for exercises. Correctly checking the right type of non-correct answer in multi-choice question. Rating order seems to be respected (ok)	5.00	5.00
				Usability				
				Implementation				
6	As a teacher, I can specify a Exercise With Variants, so that every attempt can be slightly different. An exercise with variants is another form of exercise where each question has variants, which are lists of possible question alternatives. All variants of a questions are of the same type (e.g., boolean question), but their text and the correct answer may be different. When attempting an exercise, the system will select one specific variant of each questions to submit to the students. For example, an exercise has a common text that asks to consider a piece of code, or a fragment of a UML diagram. The first question could be taken from a list of 5 variants of a boolean question; the second question could be fixed, with a single variant; and the third question could be an open answer question with 3 variants.	15.0	1.0	Requirements		ok	15.00	15.00
				Usability				
				Implementation				
7	As a teacher, I can get an automatic grade of an open answer question done by the AI, so that I can check it to confirm it or not. Open answer questions should be now automatically graded by the AI. From the point of view of the student nothing changes (regarding the feedback), but the teacher can inspect the grading and the reasoning done by the AI. The correct answer is not anymore a list of keywords, but a sentence in natural language that the teacher provides	10.0	1.0	Requirements	-20.0%	Model does not consider partial correctness (-10%) Prompt does not contain instructions to not reveal correct answer (-10%)	7.00	7.00
				Usability		Order of feedbacks for teacher is random, and I can confirm older attempts that are not accessible anymore - not sure why (-5%)		
				Implementation	-10.0%	When the answer is identical to a previous one for which there exists a public answer, feedback seems to be always regenerated (-10%)		

N.	User Story	Points	Validation Factor	Aspect	Penalties / Bonuses (v1)	Feedback	Grade (v1)	Grade
8	As a teacher, I can comment on an answer given by an AI, so that I can clarify some partially incorrect aspects. As a teacher, I can comment on some answers given by the AI in order to clarify certain aspects which are incorrect or misleading. Commenting is usually done on public answers.	5.0	1.0	Requirements			4.50	4.50
				Usability	-10.0%	No clue in the UI that reveals if there are publicly available comments by the teacher. UI is a little suboptimal when there are available comments, since they should be directly available below the answer.		
				Implementation				
9	As a teacher, I ask the AI to generate a variant for a question. As a teacher, I can ask the AI to generate a variant for a question, which should be similar but different than the ones existing in the variant list.	5.0	1.0	Requirements			4.50	4.50
				Usability				
				Implementation	-10.0%	Prompt is generated by another AI system and honestly you were not able to justify all the components. Variant generation is not always working, especially with multi-choice questions (-10%)		
	Quality Component	15.0	1.0		11.7%	Bonuses: Days with Quality Gate Failing after April 28: None (+2.5% on whole team grade - 1.75 pts) Coverage >= 90%: False	16.75	16.75
	Other Comments				-2.5%	Usage of Spring AI. You never used .entity() to ask for objects in Spring AI, you always get strings and parse them. This is suboptimal and against the use of an AI framework as shown during the lab (-2.5%)	-1.75	-1.75
	Validated Points	70				Total points		64.88
						Grade (%) for Validated Stories		92.7%
