

Software Atelier 4: Software Engineering Project (Spring 2025)

Instructors: Dr. Andrea Mocci , Prof. Raphaël Parchet

TAs: Stefano Campanella, De Vita Gianmarco, Jamshidiyantehrani Masoud,
Puccinelli Niccolò, Lamberto Ragnolini

User Stories & Final Tasks - Batch 3 (70 points) - version 1.1

Final tasks (70 points)

For the final tasks of the project, the team should be split into groups of 3-4 people. Each group will focus on one independent task, according to their preference. Possible tasks include:

- **Further reduce the technical debt in the backend.** Find a set of classes the design of which is clearly suboptimal, even if SonarQube does not report issues. Your task is to improve the design and implementation of such classes.
- **Improve the user experience in the frontend.** Study the issues in the frontend according to principles and guidelines that you may have learned in previous courses, *e.g.*, relative to style, user interaction, user experience, etc.
- **Reduce the technical debt in the frontend.** For this task, we will guide you into integrating tools for quality analysis in the frontend. After integrating such tools, you will work on fixing the corresponding issues (or a subset of them). Furthermore, you will have to find some aspects of the design of the frontend that are clearly suboptimal and fix them.
- **Test the frontend.** We will give you pointers to frameworks to test the frontend, and you will have to implement tests for 3-4 components of the frontend.
- **Prepare a demo for the Semester Project Presentations (at least 1 group member must be a leader).** Prepare a presentation with a demo of your project for the semester project presentations (which will be on **May 28**). This includes having a database that contains interesting content for the platform, and we can help you with that. The overall final state of the project will be part of the evaluation of this task, meaning that you have to ensure that **your project will be in a presentable state**. To apply for this task, you need to show that the project is in a mature state as soon as possible (ideally by **May 23**) evaluating with a good grade at least 40 points of Batch 2. A rehearsal is due on May 26/27.
- **Add some other interesting functionality.** Devise some interesting missing functionality and implement it.

Other possible tasks can be discussed with the instructor.

Before starting working on the final tasks, you must ensure the following conditions are satisfied:

- (for developers, excluding leaders) you should have completed at least 2-3 significant issues and corresponding merge requests related to Batch 2 (check with the instructor if the merge requests are enough to start the personal tasks);
- (for all) your team should have completed, and possibly validated, at least 30 user story points from Batch 2;
- you should open an issue describing briefly your plan, and tag the instructor and the TAs.

The tasks should be synced with any development part of Batch 2 that may influence them. You can start working on the final tasks only **after the instructor approves the issue**. When the task is finished, you should assign the merge request to the instructor and the TAs for review. Remember to integrate the development branch before submitting the final tasks.

The deadline for Batch 3 is 1 week after the end of the course (**June 6 2025, 23:59**) where you should have submitted the **integrated MRs** on iCorsi. You can request further extensions with penalties: 1 additional week (20%) or 2 weeks (40%). Batch 3 requires no validation - it will be independently graded by the instructor and TAs. **The submitted MRs need to be integrated with dev in any case, though.**
